Lesson 3: Forms to Sheet to Summary

Module 1 | 60 minutes | Collect, summarise, send | Adults (18+) · ages 18–65

Objective: Collect responses with Google Forms or Microsoft Forms, use AI to find themes with counts and exact quotes, and run a small AI-written Apps Script that emails you a summary, after checking every line before you run it.

Success criteria

- I can set up a Google or Microsoft Form that sends answers to a sheet.
- I can get AI themes with counts and exact quotes, and verify the counts.
- I can ask AI for a small Apps Script and explain what each part does.
- I can apply the check-before-you-run rule and run a script safely on a copy.

Key vocabulary

- **Google Forms / Microsoft Forms**: Free tools that collect answers to questions and save them in a sheet.
- **Apps Script**: A free helper inside Google Sheets that runs small programs, like sending you an email.
- **loop**: Part of a script that repeats for every row; anything inside it happens many times.
- **trigger**: A setting that runs a script automatically, for example every Monday morning.
- **permission screen**: The Google window asking what a script may do (read this sheet, send email as you).
- **Power Automate / Zapier**: Optional tools that connect apps, like "new form response → send email".

You will need

- Projector or screen share with Kitabash and the AI tools for this lesson
- Devices: 1 per learner (laptop, tablet or phone)
- Learner accounts only where allowed: see the course safety notes
- Printed worksheet (optional)
- Project files: feedback_responses_practice.csv, feedback_summary.js, l03_feedback_workflow_kit.md, l03_teacher_demo_script.md

Timed lesson plan (60 min)

Time	Stage	What happens
5 min	**Warm-up game**	"The instruction slip" paper-script game (see Unplugged).
5 min	**Watch + poll**	Play the lesson video. Poll: "Have you ever run a script or macro at work?" (yes / no / not sure).

8 min	**Live demo**	Form to sheet, privacy sweep, AI themes and the COUNTIF catch, the loop catch, run on a copy, permission screen, one email.
7 min	**Prompt Labs**	Prompt Lab: summarise form responses, then Prompt Lab: ask for a safe script. Paste the summary prompt into a chatbot with the practice data.
14 min	**Build along (pairs)**	Build steps 1–5 in pairs: one partner reads each script line aloud, the other ticks the 7-point check. Thumbs up when exactly one email arrives.
7 min	**Team games**	Quick competition: “Test on a copy or stop?” sort in teams, then the check-before-you-run order game and the “Over half?” question as a class poll.
5 min	**Show-and-tell**	Two learners show their summary email and one count they corrected.
5 min	**Probe**	New situation: the leave-request form (individual).
4 min	**Wrap-up**	Exit ticket; homework: one real form with a summary email to yourself.

Unplugged warm-up

The instruction slip (5 min): give pairs a paper “script” for a human helper: “For each envelope on the desk: open it, count the coins, and phone the boss with the total.” Ask: “How many times will the boss get a phone call?” (once per envelope!). Then fix the slip together so the call happens once, at the end. Say: “Today an AI-written script will make exactly this mistake. You will catch it.”

Teaching the idea

Today learners build a real three-step workflow: a form collects answers into a sheet, AI finds themes with counts and exact quotes, and a small Apps Script emails a summary. The script is AI-written and explained line by line; learners are not becoming programmers, they are becoming careful checkers. Teach the check-before-you-run rule as non-negotiable: explain every line, read-only, email only me and only once, run on a copy, read the permission screen, check the inbox, then schedule. Two caught mistakes: the AI says “over half” when a COUNTIF shows 5 of 18, and the first script sends an email inside the loop (18 emails). Zapier and Power Automate are optional extras; say “check the current free plan”.

Analogy: A script is like a new office helper you give a written instruction slip: you read the slip aloud before handing it over, you try it on a practice file first, and you know how to tell the helper to stop.

Live demo: 1) Show a 5-question Google Form with email collection off, and the Link to Sheets button. 2) Open the practice responses in a tab named “Form Responses 1”. 3) Find response 12’s phone number and delete it before anything goes to AI. 4) Paste the responses into Claude with the themes prompt; check the top count with =COUNTIF(E:E,"*fast*") (5). If the AI says “over half” or a wrong number, celebrate the catch. 5) Ask ChatGPT for the script with the safe prompt. Read the

script with the class and find where sendEmail sits. If it is inside the loop, show the 18-email problem; if not, show the video version. 6) Paste the checked script into Extensions → Apps Script on a COPY, run it, read the permission screen aloud, and open the one email (18 responses, 3.9, 2 low). 7) Show the Triggers clock icon and how to delete a trigger. Mention Power Automate and Zapier in one sentence each.

Questions to ask

Ask	Listen for
Why keep “collect email addresses” off on a feedback form?	So feedback is anonymous and honest, and you collect less personal data.
What must you do before pasting form comments into AI?	Remove names, phone numbers, emails and other personal details.
Where should sendEmail be in a summary script, and why?	After the loop, so it sends one email with the final numbers.
Name three things on the check-before-you-run list.	Any three: explain every line, read-only, emails only you, once, run on a copy, read permissions, check inbox, know how to delete the trigger.
How do you check an AI theme count?	COUNTIF with a keyword, or a filter, on the responses column.

Differentiation

Support
Give learners the checked script from the kit to paste (instead of writing the prompt) and focus their time on the 7-point check and running it on a copy. Pair them with a confident learner for the permission screen.

Stretch
Ask the AI to add the online and office averages (AVERAGEIF logic) to the email, then check the new lines with the same 7 points. Or sketch the same workflow in Power Automate for Microsoft Forms (check the current free plan).

Common misconceptions

Misconception	How to fix it
If the AI wrote the script, it must be safe.	AI scripts can loop emails, delete data or email the wrong people. Check every line, run on a copy.
The “unverified app” warning means the script is a virus.	Google shows it for scripts you write yourself. Continue only for a script you wrote and understand; never for a stranger’s.

AI theme counts are exact.	They can be wrong. Check with COUNTIF or a filter.
Automation means sending to everyone automatically.	Start by sending only to yourself; a human checks before anything goes wider.

Assessment

Use the Prompt Lab results (auto-checked), the quick checks and the Probe answers. Written answers arrive in your review queue.

Exit ticket
Your script sends you 18 emails instead of one. Which line is in the wrong place, and where should it go?

Homework
Make one real form for your work (feedback, orders, attendance or requests) with email collection off, link it to a sheet, and set up the summary email to yourself. Note the minutes saved compared with reading every response.

Answer key — Kitabash activities

1. Prompt Lab: summarise form responses (perform · ai lab)

Checklist: Say personal details are removed · Ask for themes · Ask for a count per theme · Ask for exact quotes · Tell the AI not to invent · Ask for actions

Strong example:

```
Here are 18 anonymous responses from a workshop feedback form; I removed all personal
details. Group the “what to improve” comments into themes. For each theme, give the
number of comments and one exact quote, word for word. Do not invent quotes or add
anything that is not in the responses. Then suggest 3 actions for the next workshop.
```

2. Prompt Lab: ask for a safe script (perform · ai lab)

Checklist: Say it is Apps Script · Name the tab and the column · Say what to calculate · Email only you · Read only, no changes · Exactly one email · Explain every line

Strong example:

```
Write a Google Apps Script for my sheet tab “Form Responses 1”. Column C has a rating
from 1 to 5. Calculate the number of responses, the average rating and how many ratings
were 1 or 2. Send one email, only to me, with these numbers and a link to the sheet. The
script must only read the sheet and never change or delete anything. Explain every line
in simple words.
```

3. Check before you run (perform · ordering)

Order: Ask the AI to explain every line → Confirm it only reads data (no delete, clear or set) → Confirm it emails only you, and only once → Make a copy of the sheet and run it there → Read the permission screen before allowing → Check your inbox: one email, right numbers → Only then add a trigger, and note how to delete it

4. Script or automation: test it on a copy, or stop and fix it first? (perform · categorize)

Looks safe to test on a copy: Reads the sheet and emails a summary to you, Sends one email, after the loop, Uses getDisplayValue to read one dashboard cell
Stop: fix it or ask before running: Has a line with deleteRow or clear(), Calls sendEmail inside a loop over every row, Emails every address found in the responses, A script from a stranger’s video that nobody has explained to you, A Zapier or Power Automate step that posts every response, phone numbers included, to a team chat

5. Over half? (perform · multiple choice)

Answer: Correct the summary to “5 of 18 said it was too fast” and check the other counts too

6. New situation: the leave-request form (probe · multiple choice)

Answer: Try Power Automate (or Zapier) with a test form, send the email only to himself while testing, and check the current free plan and company IT rules

Answer key — worksheet

1. **Key words:** Google Forms / Microsoft Forms = Free tools that collect answers to questions and save them in a sheet. · Apps Script = A free helper inside Google Sheets that runs small programs, like sending you an email. · loop = Part of a script that repeats for every row; anything inside it happens many times. · trigger = A setting that runs a script automatically, for example every Monday morning.
2. **Prompt Lab: summarise form responses:** Include: Say personal details are removed; Ask for themes; Ask for a count per theme; Ask for exact quotes; Tell the AI not to invent; Ask for actions. Example: Here are 18 anonymous responses from a workshop feedback form; I removed all personal details. Group the “what to improve” comments into themes. For each theme, give the number of comments and one exact quote, word for word. Do not invent quotes or add anything that is not in the responses. Then suggest 3 actions for the next workshop.
3. **Prompt Lab: ask for a safe script:** Include: Say it is Apps Script; Name the tab and the column; Say what to calculate; Email only you; Read only, no changes; Exactly one email; Explain every line. Example: Write a Google Apps Script for my sheet tab “Form Responses 1”. Column C has a rating from 1 to 5. Calculate the number of responses, the average rating and how many ratings were 1 or 2. Send one email, only to me, with these numbers and a link to the sheet. The script must only read the sheet and never change or delete anything. Explain every line in simple words.
4. **Check before you run:** 1 Ask the AI to explain every line · 2 Confirm it only reads data (no delete, clear or set) · 3 Confirm it emails only you, and only once · 4 Make a copy of the sheet and run it there · 5 Read the permission screen before allowing · 6 Check your inbox: one email, right numbers · 7 Only then add a trigger, and note how to delete it
5. **Script or automation: test it on a copy, or stop and fix it first?:** Looks safe to test on a copy: Reads the sheet and emails a summary to you, Sends one email, after the loop, Uses getDisplayValue to read one dashboard cell · Stop: fix it or ask before running: Has a line with deleteRow or clear(), Calls sendEmail inside a loop over every row, Emails every address found in the responses, A script from a stranger’s video that nobody has explained to you, A Zapier or Power Automate step that posts every response, phone numbers included, to a team chat
