LESSON PLAN · GENERATIVE AI (GR 6–8) BEGINNER: GEN-AI CREATORS

Lesson 1: What Is Generative AI?

Module 1 | 60 minutes | Prediction machines | Grades 6–11 · ages 11–16

Objective: Explain how a chatbot predicts the next word, say what AI can and cannot do, follow the privacy rules, and write your first three prompts.

Success criteria

- I can explain that a chatbot predicts the next word.
- I can name things AI is good and bad at.
- I can follow the privacy rule.
- I can write and check my first prompts.

Key vocabulary

- **generative AI**: AI that creates new text, pictures or sounds.
- **chatbot**: An AI you talk to by typing messages.
- **prompt**: The message or instruction you give an AI.
- **predict**: Make a best guess about what comes next.
- **hallucination**: When AI says something false as if it were true.
- **personal information**: Details that identify a real person, like a name, address or phone number.

You will need

- Projector or screen share with Kitabash and the AI tools for this lesson
- Devices: 1 per learner (laptop, tablet or phone)
- Learner accounts only where allowed: see the course safety notes
- Printed worksheet (optional)
- Project files: l01-ai-or-human-project-kit.md, l01-teacher-demo-script.md

Timed lesson plan (60 min)

Time	Stage	What happens
5 min	**Warm-up game**	Autocomplete race: learners race to finish famous sentences, then discuss why open sentences get different answers.
6 min	**Watch + thumbs check**	Play the lesson video with captions. Thumbs up / sideways / down: “AI is always right.” (Answer: thumbs down.)
7 min	**Live demo**	Teacher demo on the shared screen: predict the monsoon sentence, cricket team names, then the Great Wall myth — catch and check it together.
10 min	**Follow-along**	Everyone tries the three first prompts (under 13 in the Kitabash AI helper; 13+ in ChatGPT or Gemini with permission). Teacher

		circulates.
8 min	**Prompt Lab (pairs)**	Pairs write the quiz-poem prompt in the Prompt Lab, press Check, improve it until every item is ticked.
6 min	**Quick competition**	“Safe or never share” sort race: first three learners to finish with all cards correct win a shout-out. Review any mistakes as a class.
8 min	**Breakout: make the quiz**	In breakout rooms, learners write their own 4-line poems and mix them with AI ones on the quiz sheet. Inside the chatbot order game and the Spot the generative AI quiz for early finishers.
6 min	**Show-and-tell**	Two or three learners read a poem aloud; the class votes “AI or human?” by poll. Reveal and ask: what gave it away?
4 min	**Probe + exit ticket**	New situation: yesterday’s match, then the exit ticket in the chat.

Unplugged warm-up

Autocomplete race (5 min): the teacher says the start of a sentence (“Twinkle twinkle little...”, “Happy birthday to...”, “The capital of India is...”). Learners race to type or shout the next word. Then try an open one (“My favourite food is...”) and discuss: why did everyone agree on the first ones but not the last? That is what a chatbot does — it picks the most likely next word.

Teaching the idea

Generative AI creates new text, images or sound from patterns learned from huge amounts of examples. A chatbot produces its reply one small piece (token) at a time by predicting what is most likely to come next — a very powerful autocomplete. That is why it can be fluent and still wrong (a “hallucination”), and why it does not know the learner or today’s news unless a tool looks it up. Set two rules today that repeat every lesson: the privacy rule, and “you are the boss — check it”. Explain the age rules simply: under 13 use the Kitabash AI helper and the teacher’s screen; 13–17 may use ChatGPT, Gemini, Copilot or Perplexity with a parent’s permission; Claude is 18+ only.

Analogy: A chatbot is like a friend who has read millions of books but never been outside: great at finishing sentences, but sometimes it confidently fills gaps with things that are not true.

Live demo: Share your screen with the Kitabash AI helper (or your own adult account). 1) Type “Finish this sentence: In the monsoon, the streets of Mumbai get...” and point out that it predicts likely words. 2) Type “Give me 5 fun names for a cricket team.” Ask learners to vote for the best. 3) Type “Can you see the Great Wall of China from the Moon?” If it repeats the myth, stop and say: “It sounds sure — is it right?” Show how you would check (an encyclopedia or space agency page). If it answers correctly, say: “Good — but we still check, because next time it might not be.” 4) Show the privacy rule by typing a fake example, then deleting it: “I never type my real address — not even to test.”

Questions to ask

Ask	Listen for

How does a chatbot decide what to write?	It predicts the most likely next word, again and again.
Why can AI be wrong even when it sounds sure?	It predicts likely words; it does not check facts.
Name three things you must never type into an AI.	Any of: real names, phone numbers, addresses, passwords, Aadhaar, private photos or documents.
What is one thing AI is good at?	Ideas, explanations, first drafts.
What should you do before you share an AI answer?	Check it with a trusted source.

Differentiation

Support
Give a printed prompt card with the three starter prompts; learners only change the topic word. Pair a confident reader with a less confident one for the quiz.

Stretch
Make the quiz harder: ask the AI to write “like a 12-year-old who makes small spelling mistakes”, then explain why that makes guessing harder and why we must label AI writing honestly.

Common misconceptions

Misconception	How to fix it
AI knows everything and is always right	It predicts likely words and can be confidently wrong. Always check.
AI is a person who understands me	It is a computer program finding patterns; it has no feelings or memories of you.
It is fine to type my name and school to get better answers	Never share personal information. Describe yourself generally: “a Grade 7 student in India”.
If I ask again and it agrees, it must be true	Repeating does not make it true. Check a trusted source.

Assessment

Use the Prompt Lab results (auto-checked), the quick checks and the Probe answers. Written answers arrive in your review queue.

Exit ticket
In one sentence: why can a chatbot be wrong even when it sounds sure?

Homework
Play your “AI or human?” quiz with your family. Write down their score and which poem fooled them most — bring it to the next class.

Answer key — Kitabash activities

1. Prompt Lab: poems for the quiz (perform · ai lab)

Checklist: Say what to make · Say how many · Give a topic · Set the length · Describe the style or reader

Strong example:

```
Write three short poems about the monsoon in Mumbai. Each poem should be 4 lines long
and sound like it was written by a Grade 7 student, so my family can guess which ones
are AI and which are mine.
```

2. Safe or never share with an AI? (perform · categorize)

Safe to share: A maths question from your textbook, Your favourite cricket team, A story idea about a dragon in Delhi
Never share: Your home address, Your mum's phone number, Your password for a game, Your Aadhaar number, A photo of your friend's face

3. Inside the chatbot (perform · ordering)

Order: You type a prompt → The AI breaks your words into small pieces → It predicts the most likely next word → It adds that word and predicts again, piece by piece → You read the answer and check it

4. Spot the generative AI (perform · multiple choice)

Answer: A chatbot writing a new poem about cricket

5. New situation: yesterday's match (probe · multiple choice)

Answer: Check the official scorecard or a trusted news site

6. Explain it to a cousin (probe · free response)

Look for: predict, next word, check, private. **Example:** A chatbot does not think like a person. It predicts the next word again and again, like autocomplete, so it can sound clever but still be wrong. Always check what it says, and never tell it private things like your address or password.

Answer key — worksheet

1. **Key words:** generative AI = AI that creates new text, pictures or sounds. · chatbot = An AI you talk to by typing messages. · prompt = The message or instruction you give an AI. · predict = Make a best guess about what comes next.
2. **Prompt Lab: poems for the quiz:** Include: Say what to make; Say how many; Give a topic; Set the length; Describe the style or reader. Example: Write three short poems about the monsoon

in Mumbai. Each poem should be 4 lines long and sound like it was written by a Grade 7 student, so my family can guess which ones are AI and which are mine.

3. **Safe or never share with an AI?:** Safe to share: A maths question from your textbook, Your favourite cricket team, A story idea about a dragon in Delhi · Never share: Your home address, Your mum's phone number, Your password for a game, Your Aadhaar number, A photo of your friend's face
4. **Inside the chatbot:** 1 You type a prompt · 2 The AI breaks your words into small pieces · 3 It predicts the most likely next word · 4 It adds that word and predicts again, piece by piece · 5 You read the answer and check it
5. **Spot the generative AI:** B. A chatbot writing a new poem about cricket — Generative AI creates something new, such as a poem. The others follow fixed rules and create nothing new.

Kitabash original curriculum. Product names (ChatGPT, Gemini, Claude, Copilot, Canva, NotebookLM, Perplexity, Teachable Machine) belong to their owners; Kitabash is not affiliated with or endorsed by them. Tools and age rules change: check each tool's current terms before class.
