Lesson 1: Functions That Give Answers Back

Module 1 | 60 minutes | parameters and return | Grades 7–11 · ages 12–16

Name: _____ Class: _____ Date: _____

Practise what you learned today. Read each task carefully.

1. Key words

Match each word to what it means. Write the letter.

a. parameter ___ A. Python's value for "nothing"; what a function gives back with no return.
b. argument ___ B. Sends a value back to the line that called the function.
c. return ___ C. The actual value you pass when you call the function.
d. None ___ D. A name inside the def brackets that receives a value.

2. Plan your program

Before you type it: Write a function total_runs(fours, sixes, singles) that RETURNS the total runs: 4 for each four, 6 for each six and 1 for each single. Then print total_runs(2, 1, 3), which should show 17. Write the steps in plain English (pseudocode), then the Python you will use.

3. Predict the output: bonus points

What does this program print? Code: def add_bonus(score): ↵ return score + 10 ↵ ↵ x = add_bonus(5) ↵ print(x * 2)

a. A. 30
b. B. 15
c. C. 25
d. D. 20

4. Match each function word to its meaning

Draw a line from each word to its match.

a. def ..... A. What you get back when there is no return
b. parameter ..... B. Sends an answer back to the caller
c. argument ..... C. The value you pass in when you call it
d. return ..... D. A name in the def brackets that receives a value
e. None ..... E. Starts a new function

5. Plan your program

Before you type it: Debug it! average(a, b, c) should return the average of three scores, so print(average(30, 45, 60)) shows 45.0. It has two bugs. Fix them. Write the steps in plain English (pseudocode), then the Python you will use.

How did it go? Colour a face: 😀 I can do it · 🙂 Nearly there · 🤔 I need help

☐ I can write a function with two or more parameters.
☐ I can return a value and store it in a variable.
☐ I can explain the difference between print and return.
☐ I can use a default value for a parameter.
