LESSON PLAN · WEB DEVELOPMENT (GR 6–8) BEGINNER: WEB CREATORS · LEVEL 1

Lesson 1: Hello, web!

Module 1 | 60 minutes | tags, headings, paragraphs | Grades 6–11 · ages 11–16

Objective: Write your first web page in HTML with headings and paragraphs, and explain how a browser reads tags.

Success criteria

- I can explain how a browser reads an HTML file.
- I can write headings with h1 and h2.
- I can write paragraphs and close every tag.
- I can choose safe things to share on a page.

Key vocabulary

- **HTML**: The language web pages are written in.
- **browser**: The app that reads HTML and draws the page, like Chrome or Edge.
- **tag**: A word in angle brackets that tells the browser what something is.
- **closing tag**: The tag with a slash that ends a part, like </p>.
- **heading**: A title made with h1 to h6.
- **paragraph**: A block of normal text made with the p tag.

You will need

- Projector with Kitabash (lesson video, Web Lab)
- Devices: 1 per learner, with a keyboard
- Printed worksheet (optional)
- Project files: l01-my-first-page.html, l01-teacher-demo.md

Timed lesson plan (60 min)

Time	Stage	What happens
5 min	**Warm-up game: Human Browser**	Play Human Browser with tag cards. The learner who spots the missing closing tag picks the next browser.
5 min	**Hook and video**	Show the hook Hello, web! . Thumbs poll: “Who has seen the code behind a web page?” Play the video with captions; pause at “Spot the bug” and let learners shout the fix.
10 min	**Live demo and build-along**	Run the live demo exactly as written, then everyone builds “my first web page” with you. Thumbs check after each step.
8 min	**Challenge and games**	Web Lab: heading and paragraphs, then Predict the page, the match game and Order it. Quick competition: first three correct predictions type “h1!” in the chat.

17 min	**Project in pairs**	Breakout rooms in pairs: one types (driver), one checks every closing tag (navigator); swap every 5 minutes. Build the “All about me” page with favourites only.
5 min	**Probe: safe or not?**	Everyone does the Safe or not sort. Discuss one tricky item together (the school name).
6 min	**Show-and-tell**	Three volunteers share their preview. Class gives two stars and a wish in the chat.
4 min	**Wrap-up and exit ticket**	Fist-to-five poll on the success criteria. Exit ticket: write a heading and a paragraph.

Unplugged warm-up

Human Browser (5 min game): write tags on cards such as <h1>, , </h1>, . Volunteers hold up a card and the “browser” (another learner) must act it out: stand tall and shout for h1, talk normally for p, freeze for a closing tag. Then show a card sequence with a missing closing tag — the browser keeps shouting forever! First to spot the missing slash wins.

Teaching the idea

A web page is just a text file written in HTML. The browser reads the file from top to bottom and draws what the tags describe. Tags sit inside angle brackets; most come in pairs, and the closing tag has a slash. h1 to h6 make headings from biggest to smallest, and p makes a paragraph. The browser squashes extra spaces and new lines, so layout comes from tags, not from pressing Enter.

Analogy: Tags are like labels on lunch boxes: the label says what is inside (heading, paragraph), and the lid (closing tag) shows where the box ends.

Live demo: 1) Open the Web Lab and clear the editor. Point out the two halves: code on the left, live preview on the right. 2) Type <h1>Hello, web!</h1> slowly, naming the opening tag, the content and the closing tag with its slash. Watch the preview show a big heading. 3) Delete the slash in the closing tag. Ask: why did the whole page turn into a heading? Put the slash back. 4) Add I love mangoes. under the heading and show it appear as normal text. 5) Type a paragraph with lots of extra spaces and Enter presses inside it. Show that the browser squashes them into single spaces. 6) Add an <h2> and a second paragraph, then press Check to show the goal ticks.

Questions to ask

Ask	Listen for
What is a web page made of?	A text file of HTML tags and content that the browser reads and draws.
How is a closing tag different from an opening tag?	It has a slash before the tag name.
Which heading is biggest?	h1. The numbers go down in size to h6.

Why did my extra spaces disappear?	The browser squashes spaces and new lines; use a new p tag for a new paragraph.
What should never go on a public page?	Full name, address, school, phone number, passwords or a photo of you.

Differentiation

Support
Give learners the starter and ask them to change only the words first. A “tag buddy” card on screen: open tag, content, close tag with slash. Pair a confident typist with a learner who is new to keyboards.

Stretch
Use h3 headings inside a section, add and to make words bold and slanted, and add an <hr> line between sections.

Common misconceptions

Misconception	How to fix it
Pressing Enter in the code makes a new line on the page	The browser ignores new lines in the code. Start a new <p> for a new paragraph.
Tags show on the page	Tags are instructions; only the content between them appears.
h6 is the biggest heading	h1 is the biggest and most important; h6 is the smallest.
It is fine to put my full name and school online	Use a nickname and favourite things only. Personal details stay private.

Assessment

Use the Code Lab results (auto-checked), the quick checks and the Probe answers. Written answers arrive in your review queue.

Exit ticket
Write the HTML for a heading that says “My Page” and one paragraph under it.

Homework
Add two more sections to your “All about me” page: a favourite festival and a favourite place. Show your page to someone at home and teach them what a closing tag is.

Answer key — Kitabash activities

1. Web Lab: heading and paragraphs (perform · web lab)

Goals checked: Has an h1 page title · Has an h2 section heading · Has at least two paragraphs · Has enough words to read

One solution:

```
<!-- My first web page -->
<h1>Hello, web!</h1>
<h2>About this page</h2>
<p>This is my very first web page. I typed every tag myself.</p>
<p>I made it in the Kitabash Web Lab.</p>
<h2>Coming soon</h2>
<p>Lists, links, pictures and colours!</p>
```

2. Predict the page (perform · code output)

3. Match each piece of HTML to its job (perform · matching)

<h1> → The biggest heading: the page title · <h2> → A section heading, a bit smaller · → A paragraph of normal text · → A closing tag: the paragraph ends here · <!-- note --> → A comment the browser does not show

4. Order it: from file to screen (perform · ordering)

Order: You open a web address or an HTML file → The browser gets the HTML text file → The browser reads the tags from top to bottom → The browser draws headings and paragraphs on the screen

5. Project: All about me (favourites only) (perform · web lab)

Goals checked: Has one h1 page title · Has at least three h2 sections · Has at least four paragraphs · Has plenty to read

Example page:

```
<!-- All about me (favourite things only!) -->
<h1>All About Me: Star Coder</h1>
<p>Hi! I am a coder in Class 7. On this page you will find my favourite things.</p>

<h2>My favourite food</h2>
<p>Mango lassi on a hot summer day. Masala dosa for Sunday breakfast.</p>

<h2>My favourite sport</h2>
<p>Cricket! I like bowling more than batting, and I can bowl a slow leg spin.</p>

<h2>My favourite book</h2>
<p>Any mystery story where the clues are hidden in plain sight.</p>

<h2>One fun fact</h2>
<p>I can say hello in four languages: hello, namaste, vanakkam and hola.</p>
```

6. Safe or not? Sort what can go on a public web page (probe · categorize)

OK to share: My favourite food, My favourite cricket team, A nickname like “Star Coder”, My favourite book
Keep private: My home address, My phone number, The name of my school, My password

Answer key — worksheet

1. **Key words:** HTML = The language web pages are written in. · browser = The app that reads HTML and draws the page, like Chrome or Edge. · tag = A word in angle brackets that tells the browser what something is. · closing tag = The tag with a slash that ends a part, like .
2. **Plan your page:** Goals: Has an h1 page title; Has an h2 section heading; Has at least two paragraphs; Has enough words to read.
3. **Predict the page:** A. A big heading, then one line: “India won the match!”
4. **Match each piece of HTML to its job:** <h1> → The biggest heading: the page title · <h2> → A section heading, a bit smaller · → A paragraph of normal text · → A closing tag: the paragraph ends here · <!-- note --> → A comment the browser does not show
5. **Order it: from file to screen:** 1 You open a web address or an HTML file · 2 The browser gets the HTML text file · 3 The browser reads the tags from top to bottom · 4 The browser draws headings and paragraphs on the screen
